Exp. No. 1

Develop a lexical Analyzer to identify identifiers, constants, operators using C program.

Program:

```c
#include<stdio.h>
#include<ctype.h>
#include<string.h>
int main()
{
        int i,ic=0,m,cc=0,oc=0,j;
        char b[30],operators[30],identifiers[30],constants[30];
        printf("enter the string : ");
        scanf("%[^\n]s",&b);
        for(i=0;i<strlen(b);i++)
        {
        if(isspace(b[i]))
                {
           continue;
        }
        else if(isalpha(b[i]))
                {
        identifiers[ic] =b[i];
        ic++;
        }
        else if(isdigit(b[i]))
                {
        m=(b[i]-'0');
        i=i+1;
        while(isdigit(b[i]))
                        {
            m=m*10 + (b[i]-'0');
            i++;
        }
        i=i-1;
        constants[cc]=m;
        cc++;
```

```c
        }
    else
            {
    if(b[i]=='*')
                    {
            operators[oc]='*';
            oc++;
    }
    else if(b[i]=='-')
                    {
            operators[oc]='-';
            oc++;
    }
    else if(b[i]=='+')
                    {
            operators[oc]='+';
            oc++;
    }
    else if(b[i]=='=')
                    {
            operators[oc]='=';
            oc++;
    }
            }
        }
printf(" identifiers : ");
 for(j=0;j<ic;j++)
     {
   printf("%c ",identifiers[j]);
 }
printf("\n constants : ");
 for(j=0;j<cc;j++)
     {
   printf("%d ",constants[j]);
 }
printf("\n operators : ");
```

```c
    for(j=0;j<oc;j++)
        {
     printf("%c ",operators[j]);
    }
}
```

Output:

enter the string : a = b + c * e + 100

 identifiers : a b c e

 constants : 100

 operators : = + * +

Exp. No. 2
Develop a lexical Analyzer to identify whether a given line is a comment or not using C

Program:

```c
#include<stdio.h>
#include<conio.h>
int main()
{
        char com[30];
        int i=2,a=0;
        printf("\n Enter comment:");
        gets(com);
        if(com[0]=='/')
        {
                if(com[1]=='/')
                        printf("\n It is a comment");
                else if(com[1]=='*')
                {
                        for(i=2;i<=30;i++)
                        {
                                if(com[i]=='*'&&com[i+1]=='/')
                                {
                                        printf("\n It is a comment");
                                        a=1;
```

```
                              break;
                    }
               else
                    continue;
          }
          if(a==0)
               printf("\n It is not a comment");
     }
     else
          printf("\n It is not a comment");
}
else
     printf("\n It is not a comment");
}
```

Output:

Input: Enter comment: //hello

Output: It is a comment

Input: Enter comment: hello

Output: It is not a comment

Exp. No. 3
Design a lexical Analyzer for given language should ignore the redundant spaces, tabs and new lines and ignore comments using C

Program:
```
#include<stdio.h>
#include<stdlib.h>
#include<string.h>
#include<ctype.h>

int isKeyword(char buffer[]){
char keywords[32][10] =
{"main","auto","break","case","char","const","continue","default",
"do","double","else","enum","extern","float","for","goto",
```

```c
"if","int","long","register","return","short","signed",
"sizeof","static","struct","switch","typedef",
"unsigned","void","printf","while"};
int i, flag = 0;
for(i = 0; i < 32; ++i)
{
if(strcmp(keywords[i], buffer) == 0)
{
flag = 1;
break;
}
}
return flag;
}

int main()
{
char ch, buffer[15], operators[] = "+-*/%=";
FILE *fp;
int i,j=0;
fp = fopen("flex_input.txt","r");
if(fp == NULL){
printf("error while opening the file\n");
exit(0);
}
while((ch = fgetc(fp)) != EOF){
  for(i = 0; i < 6; ++i){
  if(ch == operators[i])
  printf("%c is operator\n", ch);
  }

  if(isalnum(ch)){
  buffer[j++] = ch;
  }
  else if((ch == ' ' || ch == '\n') && (j != 0)){
  buffer[j] = '\0';
```

```c
        j = 0;

        if(isKeyword(buffer) == 1)
        printf("%s is keyword\n", buffer);
        else
        printf("%s is identifier\n", buffer);
        }

}
fclose(fp);
return 0;
}
```

Input: flex_input.txt
```c
main ( )
{
  int a, b, c ;
  c = b + c;
  printf ( "%d" ,c ) ;
  }
```

Output:

main is keyword

out = in1 + in2 + in3 - in4

Output: out.txt

t1=in1+in2
t2=t1+in3
t3=t2-in4
out=t3

Exp. No. 17

Write a C program for implementing a Lexical Analyzer to Scan and Count the number of characters, words, and lines in a file.

Program:

```c
#include <stdio.h>
int main()
```

```c
{
    char str[100];//input string with size 100

    int words=0,newline=0,characters=0; // counter variables

    scanf("%[^~]",&str);//scanf formatting

    for(int i=0;str[i]!='\0';i++)
    {
        if(str[i] == ' ')
        {
            words++;
        }
        else if(str[i] == '\n')
        {
            newline++;
            words++;//since with every next line new words start. corner case 1
        }
        else if(str[i] != ' ' && str[i] != '\n'){
        characters++;
        }
    }
    if(characters > 0)//Corner case 2,3.
    {
        words++;
        newline++;
    }
    printf("Total number of words : %d\n",words);
    printf("Total number of lines : %d\n",newline);
    printf("Total number of characters : %d\n",characters);
    return 0;
}
```

Output:
```c
void main()
{
```

```
int a;
int b;
a = b + c;
c = d * e;
}
```
Total number of words : 18

Total number of lines : 7

Implement Lexical Analyzer using FLEX (Fast Lexical Analyzer). The program should separate the tokens in the given C program and display with appropriate caption.

Input Source Program: (sample.c)
```
#include<stdio.h>

void main()
{
int a,b,c = 30;

printf("hello");
}
```

Program: (token.l)
```
digit [0-9]
letter [A-Za-z]
%{
```

```
int count_id,count_key;
%}
%%
(stdio.h|conio.h) { printf("%s is a standard library\n",yytext); }
(include|void|main|printf|int) { printf("%s is a keyword\n",yytext); count_key++; }
{letter}({letter}|{digit})*  { printf("%s is a identifier\n", yytext); count_id++; }
{digit}+  { printf("%s is a number\n", yytext); }
\"(\\.|[^"\\])*\"  { printf("%s is a string literal\n", yytext); }
.|\n { }
%%
int yywrap(void) {
return 1;
}
int main(int argc, char *argv[]) {
yyin = fopen(argv[1], "r");
yylex();
printf("number of identifiers = %d\n", count_id);
printf("number of keywords = %d\n", count_key);
fclose(yyin);
}
```

Output:

```
G:\lex>flex token.l

G:\lex>gcc lex.yy.c

G:\lex>a.exe sample.c
include is a keyword
stdio.h is a standard library
